THE SITUATION OF WOMEN IN BREAST CANCER IN BRAZIL: EPIDEMIOLOGICAL FEATURES

Goiânia – GO
2015

BACKGROUND

Malignant neoplasm of breast sets a serious problem in the current public health setting. This reality is justified by its high incidence, morbidity and mortality, as well as the high cost involved in your treatment.

**SERIOUS

PROBLEM**

**HIGHT
INCIDENCE**

**HIGHT
MORTALITY**

HIGH COSTS

OBJETIVE

Describe the epidemiological characteristics of women breast cancer hospitalizations from 2008 to 2014

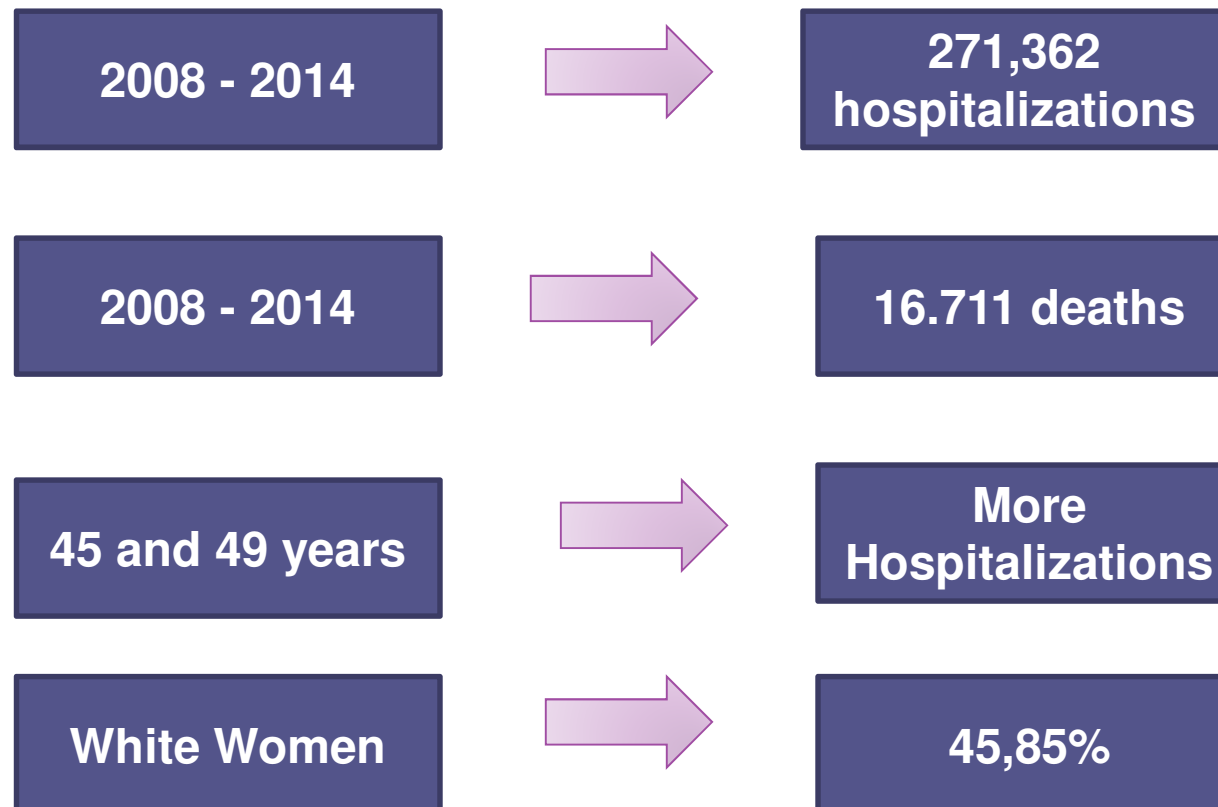

METHODS

Cross-sectional population-based study was conducted with data collected in DataSUS database.

RESULTS

In the period 2008-2014, it were registered 271,362 hospitalizations resulting from breast malignancy in Brazil.

CONCLUSIONS

The **age group** between **45 to 49 years** had a **higher incidence rate of breast cancer**. This statistic supports the **American College** recommendation of mammography performance **annually** for women between 45 and 49 years

The **Ministry of Health** has implemented **public policies** for cancer care in recent decades with the aim of reducing the incidence and mortality rates related to malignant neoplasm of breast
